

DGD Ambassador Video Handbook

How to make high-quality, educational short-form videos about Digital Gold — and stay inside the rules.

What Digital Gold is

What Is Digital Gold (DGD)?

The subject you teach. A plain-language overview of Digital Gold for ambassadors, drawn from the White Paper.

Framing reminder: Everything below is *how the system is designed*. Present it as design and ideas, never as "buy this, you'll profit." See [communications discipline](#).

In one breath

Digital Gold (DGD) is a **Layer-1 cryptocurrency** designed to behave like **sound, wealth-preserving money** rather than a speculative bet. It was created by **John Wright Gotts**, founder of the **Digital Gold Foundation**, and developed from 2014–2026 (WP, title page). The founder funded development personally and donated the completed coin to the Foundation (WP Abstract).

A "Layer-1" is a base blockchain network (like Bitcoin or Ethereum) that runs on its own, rather than being built on top of another chain.

The problem it responds to

Government-issued money loses value over time. The White Paper notes the Federal Reserve Note has lost **more than 96% of its purchasing power since 1913**, and that a 2%-per-year inflation target means a worker saving across a 40-year career sees roughly **half** of their lifetime savings eroded by debasement (WP Abstract). DGD is framed as a response to that problem, inspired by economist **Friedrich Hayek's** idea (*The Denationalisation of Money*, 1976) that private currencies should compete, and the best one for users wins.

What makes DGD structurally different

1. **Built to be spent, not just held.** Most coins have a fluctuating bid/ask price, so a merchant who accepts them converts to dollars immediately. DGD uses a **single-price architecture** so a merchant can hold it and pay suppliers in it — letting it circulate through a whole supply chain (WP Abstract, §9). See [supply & distribution](#).
2. **Fair, continuous distribution.** Instead of concentrating coins among early insiders, a **Proof-of-Participation (PoP)** model releases coins gradually as the network grows from 1,000 toward 80 million users (WP Abstract). See [supply & distribution](#).
3. **A real valuation method.** The **Crypto Fair Value (CFV)** formula values coins against a fixed benchmark instead of pure speculation. See [valuation: CFV & DGSB](#).
4. **Designed not to be a security.** Fixed rules set at inception that can't be changed, no staking rewards, fees burned, no ongoing company profiting from operation (WP Abstract, §12). See [compliance overview](#).

The intellectual roots (great explainer material)

DGD draws on the **Austrian school of economics** — this is some of the most "teachable," non-promotional content you can make:

- **Carl Menger (1892):** money emerges naturally from trade, not government decree; the most *saleable* goods (durable, divisible, portable, scarce, widely wanted) become money — historically gold and silver.
- **Ludwig von Mises:** government monopoly over money leads to debasement and a wealth transfer from workers to the financial class.
- **Friedrich Hayek (1976):** strip the monopoly; let currencies compete.

These ideas synthesize into the **Six Pillars of Perfect Money** — the backbone of most educational DGD videos.

The headline design numbers (state as design facts only)

Feature	Design value (WP)
Total supply cap	21,000,000 coins
Max circulating supply	19,000,000 (2,000,000 held in treasury for staking)
Distribution driver	N = current number of users
Network growth target	1,000 → 80,000,000 users
Consensus	Hybrid Proof-of-Work + Proof-of-Stake, refined by SegWit
Block time	64 seconds
Transaction fees	Burned (destroyed), not collected
Privacy	Native Tor V3 onion address support

⚠ **Never** turn the price-curve numbers (\$3.40 → \$100,000 across the growth curve) into a profit pitch. They describe a *mechanism*, not a promise or prediction. This is the single most common compliance mistake — see [do & don't language](#).

- DigitalGoldFoundation.org · DigitalGold.co · DigitalGoldX.com
- X: @**DigitalGoldTalk** (the Foundation's official channel) (WP §12.11)

The Six Pillars of Perfect Money

The backbone of most educational DGD videos. Synthesized from Menger, Mises, and Hayek (WP §2.2). Each pillar is a ready-made short-form topic.

Teach these as **economic concepts**. They make excellent, evergreen, non-promotional content. You can explain a pillar fully without ever telling anyone to acquire DGD.

#	Pillar	The idea	DGD's design answer (WP §2.2)
1	Scarcity	Supply must be limited by transparent, predictable rules	21M cap (19M circulating, 2M treasury); cannot be increased
2	Stable Pricing	Purchasing power should stay roughly constant	Price advances along a fixed curve tied to measurable adoption, not speculation
3	Free Adoption	Money must be chosen, not imposed by decree	Participation is voluntary; users choose when/whether/how much
4	Decentralized Governance	Rules, not rulers; no single authority can alter policy	On-chain consensus; rules fixed at inception, unchangeable
5	Freedom to Transact	Use without surveillance, censorship, or permission	Native Tor V3 onion support for private transactions
6	Adequate Circulation	Must actually flow through the economy at sufficient velocity	Single-price design + supply-chain onboarding to keep it circulating

Pillar-by-pillar (with teachable hooks)

1. Scarcity

The Fed expanded the US money supply from ~\$3 billion in 1913 to over \$21 trillion — roughly a **7,000-fold increase** — about 700,000% (WP §2.2).

Note on the figure: the White Paper phrases this as "roughly 7,000 percent," but \$3 billion to \$21 trillion is a **7,000-FOLD** increase (~700,000%). Say "7,000 times" or "7,000-fold" — a viewer with a calculator will check, and being wrong about arithmetic is fatal for a project whose whole argument is *check the math*. Flagged for the Foundation. Bitcoin proved code-enforced scarcity is possible with its 21M cap. DGD adopts the same 21M cap. **Hook idea:** "The dollar in your pocket is designed to shrink. Here's the math."

2. Stable Pricing

A 2% inflation target means the dollar loses **half its purchasing power about every 35 years** (WP §2.2). Bitcoin appreciates long-term but swings violently short-term, which hurts

its use as everyday money. DGD's design aims for predictability by tying price to adoption along a fixed curve. **Hook idea:** "Why your grandparents' \$100 bought a month of groceries and yours buys a week."

3. Free Adoption

No cryptocurrency was forced on anyone — unlike national currencies backed by legal tender laws. DGD extends this: its distribution mechanism is equally voluntary. **Hook idea:** "Nobody can force you to use a currency. So why do we all use the same one?"

4. Decentralized Governance

"Rules rather than discretion." DGD's rules were set at inception and **cannot be changed** by any single authority (WP §2.2, §12.14). The White Paper calls this the "*inversion of governance*" — there's nothing to govern because nothing changes (WP §12.15). **Hook idea:** "What if money had rules no government could rewrite overnight?"

5. Freedom to Transact

Money should let you transact "without surveillance, censorship, or permission from any intermediary." DGD integrates Tor V3 onion addressing for encrypted, anonymous transactions (WP §2.2). **Hook idea:** "Every card swipe is watched. Cash isn't. Where does digital money fit?"

6. Adequate Circulation

This is DGD's signature argument. Real money doesn't just go consumer→merchant; it flows merchant→wholesaler→manufacturer→raw-material supplier→workers. A coin instantly converted to dollars never became money — it was just a payment instrument (WP Abstract, §9). DGD's single-price design is built to let it circulate the full chain. **Hook idea:** "Most 'crypto payments' aren't really money. Here's the test that proves it."

How to turn this into a series

Six pillars = a **6-part video series**, one pillar per video, plus an intro ("the 6 things real money needs") and an outro ("how one project tries to hit all six"). See [series ideas](#).

Connects to

- [DGD overview](#) · [Valuation: CFV & DGSB](#) · [Supply & distribution](#)
- Safe phrasing → [Approved talking points](#)

Supply, Distribution & Circulation

How DGD coins are released and how the design tries to make the coin actually *circulate* as money.

Present the mechanics as **design**. The dollar figures describe how the curve works, not what anyone will earn. See **do & don't language**.

⚠ **Changed 2026-07: releases go to FUNDED accounts, not all users.** Earlier versions of this page said releases were "split equally among all current users." The live model on digitalgold.co distributes only to accounts holding an **active validation balance**. The White Paper anticipated exactly this in §5.6 ("*if the design were later changed to exclude zero-balance users, the only change would be the divisor*"). If you published content using the old wording, it overstates who receives coins — correct it.

Proof of Participation: continuous distribution

Most coins concentrate supply among early insiders or large "whales." DGD instead releases coins **continuously as the network grows**, driven by one number: **N**, the count of **confirmed network accounts** (WP Abstract, §5).

There are **no discrete levels or tiers** (WP §5.1). The curve is continuous.

What happens each time someone joins:

1. A new account is confirmed → **N** increases by one.
2. The protocol advances the price one step along a **fixed published curve**.
3. A small number of coins is released from the treasury and **split equally across accounts with an active validation balance** — every funded account receives the *same amount*.
4. Coins are delivered **immediately** to the participant's **QT wallet**, not to their web account.

Because the release is split across the funded base, the amount per account **shrinks** as the network grows. Near **N** = 1,000 a signup releases about **88.69 coins**; near the target it approaches zero. Per-signup releases across the whole journey sum to exactly **11,712,952 coins** (WP §5), carrying circulating supply from 7,287,048 to 19,000,000.

Who receives — and who doesn't

Receives from a release?	
Account with an active validation balance	Yes — the same amount as every other funded account
Account with no balance	No
Larger balance	Same amount per release — a bigger balance lasts <i>longer</i> , it does not pay <i>more</i>
Referrer	Referral recognition is separate ; it never changes release amounts

Unclaimed coins are not redistributed. They remain in / return to the Foundation treasury (WP §5.6). Your share does **not** grow because someone else failed to validate — this is the single most tempting wrong inference, and stating it would be false.

The published curve

Accounts	Price	Release at that point
1,000	\$3.40	88.6858 DGD
10,000	\$27.73	19.3349 DGD
100,000	\$226.12	4.2164 DGD
1,000,000	\$1,843.58	0.9195 DGD
10,000,000	\$15,031.06	0.2005 DGD
80,000,000	\$100,000.00	0.0507 DGD

At 80 million accounts, **19 million coins** are circulating and release **ends permanently**.

⚠ The \$3.40 → \$100,000 curve is a **distribution mechanism, not a forecast**. "Get in early before it hits \$100k" is a compliance violation. Say instead: "*The price moves along a published curve as the network grows — it's set by the protocol, not by trading.*"

The \$100,000 figure is also a **conditional maximum**, not a destination. It only arises if adoption, transactions, transaction value **and** developer activity all scale together. The framework explicitly **does not guarantee price appreciation**, and the published price can fall if metrics deteriorate. See [CFV](#) & [DGSB](#).

Total supply allocation — 21,000,000 DGD

Allocation	Amount	Share
Community distribution + staked treasury	13,712,952 DGD	65.3%
NotFiat, LLC retained treasury	5,000,000 DGD	23.8%
Founding team, developers, beta testers	2,287,048 DGD	10.9%

Of the 21M, **19M is the maximum that can ever circulate**. The remaining **2,000,000 is permanently locked** in the treasury for staking — non-circulating, and there to make a 51% attack impractical. Staking rewards and all transaction fees are **burned**, so supply can only decrease.

(The community figure of 13,712,952 = the 11,712,952 of per-signup releases **plus** the 2,000,000 staking lock. Both numbers are correct; they're counting different things.)

How validation works mechanically

- Participants fund a **DigitalGoldX** web account at **digitalgold.co** with **ERC-20 USDC or USDT — \$20 minimum, \$500 current cap** (the cap is a policy setting and can change).
- Checkout shows an **Estimated DGD** figure before payment. It can shift slightly if more accounts confirm before the payment clears.
- The balance is drawn down as releases occur, and **earns for as long as it lasts**. When it's exhausted, that account stops receiving until it's funded again.
- Delivered coins land in the participant's **QT wallet** — self-custody, keys held by the participant, and they arrive even if the web account is unavailable (WP §5.6).

The web account and the wallet are different things. The account is the validation interface; the wallet is custody. Getting this distinction right matters — it's the most common point of confusion for newcomers, and it's also the heart of the self-custody story.

Single-price architecture (the circulation engine)

Here's the design idea that distinguishes DGD from every other coin (WP §8, §9):

- Every other coin has a fluctuating **bid/ask** price. A merchant who accepts it faces a choice: hold and eat the volatility, or convert to dollars immediately. The rational merchant converts — so **the coin transacts once and exits**. It never became money.
- DGD eliminates bid/ask trading via **cooperating-venue exclusivity agreements**, producing a single published price. A merchant can **hold** DGD and **pay suppliers** in DGD. The supplier does the same. The chain continues link by link.

When the chain runs all the way to the raw-material owner, "DGD has become money" in the operational sense (WP Abstract, §9).

The lumber example (WP §10): the White Paper walks dimensional lumber from retail point-of-sale back through wholesaler, manufacturer, and raw-material extraction. Concrete, visual, and excellent video material.

Teaching angles

- **"Why most crypto payments aren't really money"** (the convert-to-dollars problem)
- **"A currency where everyone participating gets the same amount"** (equal-per-funded-account split)
- **"The whale problem, and one attempt to fix it"** (continuous vs. front-loaded distribution)
- **"A bigger balance doesn't get you a bigger share — it just lasts longer"** (counter-intuitive, true, and safely non-promotional)

Valuation: The CFV Formula & the DGSB Benchmark

How DGD frames "what a cryptocurrency is actually worth." Strong explainer material because it's analytical, not promotional.

Teach this as a **measurement framework**, the way you'd explain how the meter or kilogram is defined. Do **not** use it to argue DGD is "undervalued" or will rise — that crosses into investment framing. See [do & don't language](#).

The core analogy (use this on camera)

Every measurement system needs a fixed standard. The meter is defined by the speed of light; the kilogram by the Planck constant. They don't change just because the thing being measured changes (WP §3.1). Crypto never had such a standard — so Bitcoin's price became the only signal, and every other coin traded as a leveraged bet on Bitcoin (WP §1).

The Foundation proposes one: the **Digital Gold Standard Benchmark (DGSB)**.

The DGSB — a frozen snapshot

In **December 2024**, Bitcoin first touched **\$100,000**, at a market cap of about **\$1.983 trillion** — valued not by a Reddit thread but by the world's largest asset managers and the regulated ETF infrastructure (WP §3.2). The DGSB freezes that moment as a fixed reference point. It does **not** track Bitcoin's price afterward; it's a snapshot (WP §3.3).

The benchmark captures four measurable fundamentals:

Metric	Bitcoin @ Dec 2024	Weight in CFV
Adoption (unique holders)	~80 million	70%
Annual Transactions	~6.09 billion	10%
Annual Transaction Value	~\$13.49 trillion	10%
Active Developers	~905 contributors	10%

(WP §3.2, §4.) Adoption dominates because a currency's worth comes mostly from how many people actually use it.

The CFV formula — plain version

Crypto Fair Value (CFV) measures any coin's fundamentals against the frozen DGSB and produces a "Fair Coin Price." If a coin's fundamentals improve relative to the benchmark, its

Fair Coin Price rises; if they deteriorate, it falls. **Bitcoin itself is measured against the benchmark on equal terms — no special treatment** (WP §3.3).

This mirrors how gold worked historically: gold didn't change to flatter the currencies measured against it; currencies rose or fell on their own merits (WP §3.3).

Why it's good content: it reframes "is this coin overpriced?" from vibes into a transparent, reproducible calculation anyone can verify with public data (WP §1). That's a genuinely interesting, non-salesy story.

Teaching angles

- **"Crypto has no ruler — here's why that's a problem."** (the missing-standard idea)
- **"Why every altcoin is basically a bet on Bitcoin."** (structural dependency, WP §1)
- **"How do you measure what a coin is *really* worth? Four numbers."** (the CFV metrics)
- **"They froze Bitcoin's best day into a permanent yardstick."** (the DGSB snapshot)

After distribution ends: monthly recalculation

The curve is only the **distribution phase**. Once 19,000,000 coins are circulating and releases stop, the price stops being set by the curve and starts being set by the **full CFV calculation applied to DGD's own measured metrics**, recalculated and published **monthly** (WP §11).

This is the part most explainers miss, and it's the most honest thing in the framework:

The framework does not guarantee price appreciation. If DGD's adoption, transactions, transaction value or developer activity deteriorate, the CFV produces a **lower** Fair Coin Price, and the published price **declines accordingly** (WP §11.2).

The same logic caps the headline number. **\$100,000 at 80 million accounts is a conditional maximum, not a destination** — it only arises if *all four* metrics scale proportionally with adoption. Adoption alone gets you a Composite Score of 0.70, not 1.0. If the other three lag, the Fair Coin Price at the target is **lower** than \$100,000 (WP §4.3).

Saying "\$100k is where this ends up" is both non-compliant *and* factually wrong. Saying "the formula produces \$100,000 only if every input scales together, and it can produce less" is accurate, safe, and far more interesting.

Hard line for ambassadors

You may explain the formula and the metrics. You may **not**: - claim DGD is "undervalued" or "will reach \$X," - compare CFV outputs to argue someone should acquire DGD, - imply the framework predicts profit.

Keep it at: *"This is the method the framework uses to assign a fair value."*

Connects to

- [DGD overview](#) · [Six Pillars](#) · [Supply & distribution](#)
- [Glossary](#) (CFV, DGSB, Fair Coin Price, Composite Score)

The Platform, Tools & Protocol Specs

What actually exists at **digitalgold.co** — the live tools, the wallet, the technical specs, and the surrounding ecosystem. Useful for two things: getting your facts right on camera, and pointing viewers at something real instead of a landing page.

Live figures below are a **snapshot verified 2026-07-19**. They move constantly. Never state a current price or account count from memory — open the Stats page and read it, or say "as of today" and show it on screen. See [do & don't language](#).

Live tools you can actually show

Tool	Status	What it's good for on camera
Stats	Live	The model calculator. Drag to any account count and watch price, supply, market cap and per-account release change. The single best screen-recording asset the project has.
Block Explorer	Live	Real on-chain data — blocks, transactions, the oracle price feed. Proof the thing exists.
P2P DEX	Preview	Swapping at the published price with no order book or spread. Preview only for now.
Marketplace & Escrow	Q3/Q4 2026	Goods and services at the published price with decentralised escrow. Not live — say "coming," never "available."
GitHub	v26.2.0-beta	MIT-licensed source: burn mechanism, oracle pricing, Tor V3 engine, consensus.

The Stats calculator is the demo to lead with. It turns the abstract "price follows a published curve" claim into something a viewer watches happen. Screen-record it, don't describe it.

Snapshot — verified 2026-07-19

Metric	Value
Confirmed accounts	3,210
Published price	\$9.84630
Circulating supply	7,413,838 DGD
Market cap	\$72,998,838
Release at next account	~40.9978 DGD
Per funded account	~0.01277191 DGD

Note the last two lines together — they're the clearest illustration of how the split works. A release of ~41 DGD divided across the funded base is a fraction of a coin each. That's the mechanic, and it's honest about scale.

The wallet

The **DGD QT wallet** is a self-custodial desktop full node — **Windows, macOS, Linux only. No iOS, Android, or browser wallet.** That constraint trips people up constantly, so state it early in any onboarding content.

- Current build: **v26.2.0-beta**, published with SHA-256 hashes on the download page.
- Every running wallet is a **node** — running one supports the network.
- Delivered DGD lands in the QT wallet, **not** the web account. Keys stay with the participant.
- Linux ships as a portable archive, not a `.deb` — the Software Centre won't recognise it, so Linux users need the terminal (`tar -xzf` , `chmod +x` , run). Qt5 dependencies may be needed.

Always tell people to verify the hash on the download page. An ambassador sending viewers to a wallet download without mentioning verification is doing them a disservice.

Protocol specs

Spec	Value
Max supply	21,000,000 DGD (fully premined)
Max circulating	19,000,000 DGD
Permanent treasury lock	2,000,000 DGD (staking, non-circulating, anti-51%)
Block target	64 seconds
Block size	2 MB dynamic
Transaction fee	0.00001 DGD — burned
Staking rewards	Burned — zero staking inflation
Privacy	Native Tor V3 onion addressing
Consensus	Hybrid Proof-of-Work + Proof-of-Stake , refined by SegWit (WP)
SegWit	Implemented
Licence	MIT open source

Lineage matters and is a good story: DGD's **Proof-of-Stake component** is derived from the **Blackcoin** model — launched in early 2014 by the same core contributors, one of the first pure Proof-of-Stake chains — **with one critical modification: there are no staking rewards** (WP). Be precise here: Blackcoin supplies the PoS half, not the whole consensus. DGD is a *hybrid* PoW+PoS chain. "Built on twelve years of proof-of-stake" is a verifiable, non-promotional credibility point that doesn't touch price.

Because both staking rewards and transaction fees are burned, **no new coins are ever created and supply can only fall**. That's a cleaner scarcity story than most chains can tell.

The ecosystem

Property	What it is
digitalgold.co (DigitalGoldX)	The platform — validation, wallet downloads, stats, DEX, marketplace
digitalgoldfoundation.org	The Foundation — the self-regulating body setting CFV fair-value standards
@DigitalGoldOrg	Foundation account listed on the site — network updates
@DigitalGoldTalk	Podcast / news — and the channel the White Paper names for announcing referral, promotional and onboarding recognition (WP §10.1)
DGD Ambassadors	The ambassador Telegram

Two X accounts, two jobs: the site lists **@DigitalGoldOrg** for network updates, while the White Paper routes **recognition announcements** through **@DigitalGoldTalk**. Watch both; don't call either "the" official channel.

The Foundation and the platform are **different entities** doing different jobs — the Foundation sets standards, the platform operates validation. Blurring them is a small inaccuracy that a sceptical viewer will notice.

Using this material without breaking the rails

Safe: - Screen-record the Stats calculator and narrate the *mechanism*. - Show the Explorer to demonstrate the chain is real and public. - Walk through wallet download + hash verification as a security lesson. - Explain the burn mechanics, block time, or Tor V3 as engineering. - "Here's what the protocol specifies" framing throughout.

Not safe: - Dragging the Stats slider to 80,000,000 and lingering on **\$100,000**. That's a price projection with extra steps, and it's the most tempting thing on the whole site. If you show the far end of the curve, say plainly that it's a **conditional maximum** requiring all four CFV metrics to scale, and that the framework does not guarantee appreciation. - Describing the Marketplace or DEX as available. They aren't yet. - Quoting a live price without showing it and dating it. - Implying that running a node or holding a balance produces yield — **it doesn't**; staking rewards are burned.

Participation Pathways — and Where Ambassadors Fit

The four ways people participate in DGD, and the one that defines what you do as a content-creating ambassador.

The four pathways (WP §10.1)

Pathway	What it rewards
Validation	Funding an account and receiving an equal share of each release (the main distribution mechanism)
Referrals	Introducing new participants — single-level, one-time bonus
Promotional participation	Posting DGD-related educational content publicly ← <i>this is you</i>
Supply-chain onboarding	Bringing merchants and supply-chain partners into Layer-1 coin acceptance

Referrals: what this is NOT

This matters enough to state plainly, because it's the first thing a sceptical viewer will assume and the fastest way for an ambassador to create a real problem.

There are no levels, tiers, ranks, or downlines. There is no recruiting-for-income.

- Inviting is **single-level**. You and the person you invite each get a **one-time bonus** when they join.
- That bonus **never changes the DGD amount anyone earns from releases** — not yours, not theirs.
- You do not earn from people *they* invite. There is no second level, no cascade, no override.
- A referral, a bigger balance, or any kind of badge **cannot buy a bigger share** of a release. Every funded account receives the same amount.

Do **not** describe DGD in language borrowed from multi-level marketing — "build your team," "downline," "residual income," "get others under you." It is inaccurate, it invites exactly the regulatory reading the Foundation's structure is designed to avoid, and the compliance linter will fail your script for it.

The specific referral amounts and eligibility rules are **not in the White Paper** — they're announced through the Foundation's channels (primarily @DigitalGoldTalk on X). Don't quote figures you can't source and date.

You are the "Promotional participation" pathway

The White Paper defines it directly (WP §10.1):

"Participants who post DGD-related content publicly, including educational explanations, technical analyses, commentary on the framework, or other contributions to the public conversation about DGD, may earn DGD recognition through programs the Foundation operates. ... The promotional pathway rewards the work of public discourse that grows the broader awareness of DGD."

Note the word the White Paper uses for what you make: **educational explanations, technical analyses, commentary**. Not sales pitches. The pathway exists to grow **awareness and understanding**, not to drive purchases.

Specific recognition structures are announced through the Foundation's official channels — primarily **@DigitalGoldTalk on X** (WP §10.1). This wiki does not set or promise any recognition amounts; check official channels.

The compliance consequence you must understand

Because the promotional pathway can pay you **DGD recognition** for posting, you have a **material connection** to the Foundation in the eyes of the FTC and the platforms. That means:

1. Your content is treated as **branded/commercial content**, and you must **disclose** it. → **FTC disclosure**
2. You're still bound by the Foundation's **communications discipline** — educational, never investment framing.
3. Platform financial-promotion rules apply to you. → **platform policies**

This is not a reason to avoid the work — it's a reason to do it cleanly. Disclosed, educational content is exactly what the pathway is designed to reward.

What "good" looks like for this pathway

- Explaining a Six Pillar concept clearly.
- Walking through the CFV idea or the single-price circulation argument.
- Commentary on monetary history, inflation, Austrian economics.
- Honest "here's how the design works" technical breakdowns.

What crosses the line (don't)

- "Buy DGD before it moons." ☐ (investment solicitation)
- "I made money validating." ☐ (return claim)
- "This will hit \$100k." ☐ (price projection)

- Undisclosed paid posts. ☐ (FTC violation)

See the full list in [do & don't language](#).

The other pathways, briefly (so you can explain them accurately)

- **Validation** is the core engine — see [supply & distribution](#).
- **Referrals** reward the direct introduction only: single-level, one-time, and with no effect on what anyone earns from releases (see above).
- **Supply-chain onboarding** is the multi-year work of getting merchants → wholesalers → manufacturers → raw-material suppliers to accept qualifying Layer-1 coins, with recognition at each link onboarded (WP §10.2). It's how the "Adequate Circulation" pillar gets realized in the real economy.

The chain here is a **commercial** one — retailer to wholesaler to manufacturer — not a recruiting downline. You're rewarded for onboarding *businesses* into accepting qualifying Layer-1 coins (DGD is one of several, and merchants aren't required to take DGD exclusively), not for enrolling people beneath you. Keep that distinction explicit when you explain it, or it will be misheard as MLM.

DGD as a "Safe Harbor" Coin

One of DGD's strongest — and most *misunderstood* — talking points. Get the meaning right and it's a great educational topic. Get it wrong and you walk straight into the one trap this whole wiki warns about.

Read this box twice. "Safe harbor" here is a **legal/regulatory** term — it means DGD *is designed to fall outside securities law*. It does **NOT** mean DGD is a "safe investment," a "safe bet," or a "safe haven" for your money. Those are investment claims and they're banned (**communications discipline**). Worse: framing DGD as a profit play **destroys** the very classification that puts it in the safe harbor. More on that below.

What "safe harbor" actually means (the legal meaning)

A regulatory **safe harbor** is a set of conditions that, if you meet them, keep you on the right side of a law. For crypto, the question is always: *is this token a security?* (If yes, it triggers heavy securities regulation.)

The White Paper (§12.8) ties DGD to two 2026 developments:

1. **The March 17, 2026 Joint Interpretive Release** — a five-part taxonomy of crypto assets: **digital commodities, digital collectibles, digital tools, payment stablecoins** (under the GENIUS Act), and **digital securities**. The **first four are explicitly NOT securities**; only "digital securities" (tokenized stocks/bonds) are (WP §12.7).
2. **The Atkins "Regulation Crypto Assets" framework** — proposed by SEC Chairman Paul Atkins, building on Commissioner Hester Peirce's earlier **Token Safe Harbor**. It contemplates a startup exemption, a fundraising exemption, and an **investment-contract safe harbor** clarifying when tokens are **not** securities (WP §12.8).

Why DGD aligns (state these as design facts)

The Interpretive Release defines a **digital commodity** as (WP §12.7):

"a crypto asset intrinsically linked to and deriving its value from the programmatic operation of a functional crypto system, as well as supply and demand dynamics, rather than from expectations of profit."

DGD fits at the most basic level: - Its value comes from the **protocol's operation + supply and demand**, with supply fixed at **21 million** coins. - Its framing is **wealth preservation, not profit expectation** (WP §12.7). - The founder **self-funded** development and donated the coin; there was **no capital raise**, so DGD doesn't even need to *rely* on the startup/

fundraising exemptions — it satisfies the principles outright, as a **distributor, not an issuer** (WP §12.8).

So "DGD is a safe harbor coin" = "**DGD is designed to qualify as a digital commodity, not a security.**" That's the accurate, powerful claim.

⚠ **The trap (this is the important part)**

The digital-commodity classification hinges on value coming from the protocol "**rather than from expectations of profit.**"

That means: **the moment an ambassador frames DGD as a way to make money, they are arguing — in public, on the record — that DGD's value comes from profit expectation.** That is the *exact opposite* of what the safe harbor requires. You wouldn't just be breaking the **communications discipline**; you'd be handing a regulator the argument that DGD is a security after all.

This is why the discipline and the legal posture **reinforce each other**:

If you say...	You break...	...and you also...
"DGD is a safe place to park money / safe haven"	the discipline	imply it's held for value-protection = investment framing
"Safe harbor = safe investment"	the discipline	conflate a <i>legal</i> term with a <i>financial</i> claim
"It'll go up, get in"	the discipline	assert value = profit expectation → attacks the digital-commodity status

The one-liner to remember: *Safe harbor is about the law, not your wallet.*

□ **How to teach "safe harbor" safely**

You're explaining **why DGD is structured to not be a security** — a genuinely interesting, non-promotional topic.

Safe statements: - "DGD is designed to qualify as a *digital commodity* — not a security — under the 2026 crypto framework." - "Its value is meant to come from how the protocol works and supply and demand — not from expecting a profit. That's literally the legal test." - "The founder funded it himself and ran no token sale, so it's structured as a distribution, not a fundraise." - "Most coins argue about whether they're securities *after* launch. DGD was designed around the question from day one."

Unsafe (never): - "It's a safe investment / safe haven / safe bet." □ - "Safe harbor means you can't lose." □ - "Regulators approved it" — □ (it's a *designed alignment* and a *reasoned*

position, not an approval; the White Paper itself calls its non-security stance "a reasoned legal analysis, not a guarantee," and admits a regulator could disagree — WP §12.16).

Example: ready-to-shoot script — "What's a 'Safe Harbor' coin?"

Time	Spoken	On-screen text	Visual
0-1s	"'Safe harbor' in crypto does NOT mean what you think."	NOT WHAT YOU THINK	Harbor/anchor icon
1-6s	"It's a legal term — not a promise about your money."	LAW, NOT YOUR WALLET	Gavel + coin
6-28s	"In 2026 a new framework split crypto into categories. Most coins — called 'digital commodities' — aren't securities, <i>as long as</i> their value comes from how the protocol works and supply and demand, not from people expecting a profit. Digital Gold was designed to fit that definition: fixed supply, self-funded, no token sale, framed as money — not a money-maker (WP §12.7-12.8)."	DIGITAL COMMODITY ≠ SECURITY	Five-box taxonomy; DGD slots into "commodity"
28-37s	"So when people call it a 'safe harbor' coin, they mean it's built to stay outside securities law — not that it's a safe bet. Read the framework yourself; link below."	SAFE ≠ SAFE INVESTMENT	Outro card

Disclosure: add the standard sponsored + not-financial-advice layers. → **FTC Compliance note:** never let the word "safe" drift toward "safe investment." Say "outside securities law."

More hook ideas (compliant)

- "Crypto finally has rulebook categories. Here's the one Digital Gold was built for."
- "Is your coin a security? There's now a test. Let's run it."
- "The SEC's own definition has a phrase that decides everything: 'rather than from expectations of profit.'"
- "Why a coin would *want* to be called 'boring infrastructure.'"

The rules

The Golden Rules of DGD Communication

The single most important page in this wiki. These rules come directly from the Foundation's own commitments in the White Paper. They are not optional.

Where these rules come from

White Paper §12.11, "Marketing and Communications Discipline," states the Foundation's communications:

"...do not characterize DGD as an investment, do not project specific price appreciation, do not promise returns from any Foundation activity, and do not solicit participation on the basis of expected profits."

It continues: communications **describe** DGD's design, the CFV framework, the monetary-reform mission, and the mechanics of validation — so that participants decide "based on their own evaluation of the design and the framework, not on the basis of Foundation representations about profit potential" (WP §12.11).

This discipline explicitly applies to the Foundation's **authorized communications channels** — and as a rewarded ambassador you are speaking into that same public record.

The Five Golden Rules

1. Never call it an investment

DGD is **money / a monetary system / a currency design** — not an investment, asset to flip, or opportunity. The White Paper says plainly: *"This is not a speculative instrument"* (WP Abstract).

2. Never predict the price

No "it'll hit \$X," no "going to \$100k," no "early," no charts implying future gains. The price curve is a **distribution mechanism**, not a forecast (WP §5). You may explain *how the curve works*; you may not say *where it's going for your benefit*.

3. Never promise returns or profit

No "returns," "ROI," "passive income," "you'll make money," "I made money." No party earns income from DGD's operation by design — there are no staking rewards and fees are burned (WP Abstract, §12).

4. Never solicit on the basis of profit

Don't say "buy now," "get in before...," "don't miss out." You can invite people to **learn, read the white paper**, and **evaluate the design** — not to chase gains.

5. Always stay educational and honest

Describe design, economics, history, and mechanics. Acknowledge uncertainty openly — the White Paper itself does: it calls its non-security position "*a reasoned legal analysis, not a guarantee*" and admits a regulator could reach a different conclusion (WP §12.16). Honesty is on-brand.

What you CAN do (lots)

- Explain inflation, sound money, and Austrian economics.
- Teach the Six Pillars, the CFV/DGSB framework, PoP distribution, single-price circulation.
- Give accurate, sourced "how it's designed to work" breakdowns.
- Share your honest interest in the **ideas**.
- Point people to the white paper and official channels to judge for themselves.

The mindset

You're a **teacher and explainer**, like a good science communicator — not a salesperson and not a hype account. The best DGD content would be valuable to someone who never acquires a single coin. If your video only makes sense as a reason to buy, rewrite it.

If someone asks you "will I make money?"

Safe answer: "*I can't tell you that, and I won't — I'm not a financial advisor and this isn't investment advice. What I can do is explain how the system is designed. Whether it's right for you is your call after your own research.*"

Do & Don't Language — The Phrase Cheat-Sheet

Pin this next to your editing setup. Left column = rewrite or delete. Right column = safe alternative.

🚫 Banned / 🔄 Rewrite

🚫 Don't say	🔄 Say instead
"DGD is a great investment"	"DGD is a monetary system designed to work like sound money"
"It's going to \$100k / to the moon"	"The price advances along a fixed curve as the network grows"
"Get in early before it rises"	"Here's how the distribution is designed to work"
"You'll make money / passive income / ROI"	"No one earns income from operating the network — fees are burned by design"
"Guaranteed returns"	"Nothing here is guaranteed; it's a reasoned design, and the white paper says so"
"I made \$X validating"	"Here's how validation is designed to work, mechanically"
"Don't miss out / last chance"	"If the idea interests you, the white paper explains it in full"
"This will replace the dollar"	"This is proposed as a competing private currency, in Hayek's sense"
"Financial freedom / retire on this"	"A design aimed at preserving purchasing power"
"Trust me, it's the next Bitcoin"	"Here's how its design differs from Bitcoin's"
"Buy now / link to buy in bio"	"Read the white paper / official channels in bio to learn more"

Words to avoid entirely

invest, investment, investor, returns, ROI, profit, gains, passive income, moon/mooning, 100x, pump, early, get in, don't miss out, guaranteed, risk-free, financial freedom, retire, the next [Bitcoin/Ethereum], price target, undervalued, cheap, deal.

Words that are safe and on-brand

money, currency, monetary design, sound money, purchasing power, scarcity, circulation, distribution mechanism, protocol, fixed rules, Austrian economics, framework, valuation method, educational, mechanics, design, white paper, decentralized.

Topic-specific traps

"Safe harbor" (legal term — never "safe investment")

❏ Don't say	❏ Say instead
"DGD is a safe harbor — a safe place for your money"	"DGD is designed to stay <i>outside securities law</i> — that's what 'safe harbor' means legally"
"Safe harbor means you can't lose"	"Safe harbor is about regulation, not your wallet"
"Regulators approved DGD"	"DGD is <i>designed to align</i> with the framework; it's a reasoned position, not an approval (WP §12.16)"
"It's a safe haven asset"	"It's designed as a <i>digital commodity</i> — money, not an investment haven"

Remember: calling DGD a profit play actually **attacks** its digital-commodity status, which requires value to come from the protocol "rather than from expectations of profit."
→ [safe-harbor page](#)

"Degen" (speak to the culture — never sell a degen play)

❏ Don't say	❏ Say instead
"Ape into DGD" / "the next 100x gem"	"Tired of the casino? Here's a different philosophy of money"
"This is the degen bag that prints"	"DGD is the <i>anti</i> -degen coin — boring on purpose"
"Don't be exit liquidity — buy this instead"	"Don't be exit liquidity — <i>understand</i> what money is"

You may use degen lingo to **hook attention and contrast**; you may not use it to imply gains. → [positioning & audiences](#)

The "rewrite reflex"

Whenever a sentence implies **the viewer will be financially better off**, stop and rewrite it to describe **how the system works** instead. Same facts, different frame.

- Before: "Coins are released as users join, so getting in early means more coins." ❏
- After: "Coins are released as accounts join and split equally across funded accounts, so the per-account share shrinks as the network grows." ❏ (mechanics, no profit implication)

Visual & on-screen text counts too

The rules apply to **captions, on-screen text, thumbnails, hashtags, and AI voiceover** — not just what you say out loud. A clean script with a "👉 TO \$100K" thumbnail still violates the discipline.

Hashtags

- 🚫 #investment #1000x #moonshot #getrichquick #pump
- 🚫 #soundmoney #economics #monetarypolicy #austrianeconomics #cryptoeducation #fintecheducation
- Disclosure tags belong at the **front**, not buried: lead with #Ad or #Sponsored. → [FTC disclosure](#)

Connects to

- [Communications discipline](#) · [Approved talking points](#) · [Pre-publish checklist](#)

FTC Disclosure — When and How to Say "Sponsored"

If you receive **anything of value** for posting — DGD recognition, free products, perks — you have a **material connection** and US FTC rules require you to disclose it clearly. This is separate from, and in addition to, the Foundation's [communications discipline](#).

When disclosure is required

You must disclose if you get **any** of: DGD recognition through the [promotional pathway](#), payment, free products, event invites, discounts, or "any other form of value exchange." The FTC treats a missing disclosure on a financial/crypto promotion as **high-risk** because of potential financial harm.

When in doubt: disclose. There's no penalty for over-disclosing.

How to disclose correctly (2026 standard)

The FTC's bar in 2026 is that disclosures must be **obvious to an average viewer immediately** — unavoidable, before they engage, not buried.

Do all three for short-form video:

1. **Spoken** — say it out loud in the **first few seconds**: *"This is a sponsored educational video — I take part in Digital Gold's ambassador program."*
2. **On-screen text** — a clear overlay (high-contrast, readable) in the opening, e.g. "Sponsored / Ambassador content."
3. **Caption** — put **#Ad** or **#Sponsored** at the **very start** of the caption, not after a wall of hashtags.

Use the platform's built-in tool too: - Instagram/Facebook: turn on the **Paid Partnership** label. → [platform-policies.md#instagram-reels](#) - TikTok: toggle the **branded content / paid partnership** disclosure. - YouTube: tick "**contains paid promotion**." - X: use the **paid partnership** label.

What does NOT count (FTC will reject these)

- □ "#ad" at the end of 15 hashtags.
- □ Tiny, low-contrast text that flashes by.
- □ "Thanks to my partners" with no clear sponsorship language.
- □ Disclosure only in a pinned comment.

Why this is doubly important for DGD

A crypto/financial promotion with a missing disclosure is exactly what the FTC has been enforcing against (celebrity crypto settlements in 2024–2025). Penalties can run **\$51,000+ per violation** and **stack across every post**. And remember: a disclosure says you were *rewarded* — it does **not** let you make investment claims. You still cannot promise returns or predict price. Disclosure + discipline, always both.

Plain-English disclosure scripts (copy these)

- Opening line: *"Quick heads-up: I'm part of the Digital Gold ambassador program, so this is sponsored — and it's educational, not financial advice."*
- On-screen (0–3s): **"SPONSORED · AMBASSADOR · NOT FINANCIAL ADVICE"**
- Caption start: **"#Ad — educational, not financial advice. ..."**

Connects to

Not legal advice. FTC guidance evolves — verify current rules at [ftc.gov](https://www.ftc.gov) and route specific questions to a qualified attorney.

AI-Content Disclosure — Labeling Synthetic Media

Every major platform now requires you to **label realistic AI-generated or altered content**. Since this wiki is all about making video with AI tools, this matters on most of your posts.

The simple rule

Label it when AI makes something *realistic* that a viewer could mistake for real — a real-looking person, voice, place, or event. You generally **don't** need to label AI used as **production assistance** (idea generation, scripting, outlines, captions, basic editing).

AI use	Disclose?
AI script / ideas / outline / title	☐ No
AI captions / basic edit / b-roll cleanup	☐ No (production assistance)
AI voiceover that sounds like a real person	☐ Yes
AI avatar / talking head / face	☐ Yes
Realistic AI video of people/places/events	☐ Yes
Altering real footage to look different than reality	☐ Yes
Obvious cartoons, clearly-stylized animation, abstract motion graphics	Usually ☐ (not "realistic")

Platform by platform

YouTube (Shorts included)

Disclosure of "meaningfully altered or synthetically generated" realistic content is **mandatory** (fully enforced since May 21, 2025; policy refreshed Jan 2026). At upload, in YouTube Studio → details → **"Altered content"** → **Yes**. YouTube adds a "Modified or Synthetic" note. If you use YouTube's **own built-in generative effects**, disclosure is handled automatically. **As of May 2026, YouTube runs automatic AI detection and can apply the label even if you don't self-disclose.** Repeatedly skipping required disclosure can mean forced labels, warnings, removal, or YPP suspension. Good news: **labeling does not reduce reach or monetization.** Takes <30 seconds.

TikTok

Toggle the **AI-generated content** label when content is realistic AI. **TikTok now auto-detects synthetic media via C2PA Content Credentials and will auto-apply a "Contains AI-generated content" label even without your input** — so self-label first.

For a paid partnership, remember you owe **two** disclosures: the Branded Content toggle *and* the AI label. AI-assisted text (scripts, hashtags) is exempt.

Instagram / Meta

Meta applies "**AI info**" labeling to realistic AI imagery/video and expects creators to disclose. **As of 2026, AI-content disclosure is mandatory for all advertising/boosted content across Facebook and Instagram, applied globally.** Add your own on-screen note for realistic synthetic media.

X (Twitter)

X has a "**Made with AI**" label and a "**Manipulated Media**" tag. **In 2026 X is adding a pre-share warning prompt that flags potentially AI-generated content before a repost.** Labeling is largely creator-disclosed, but unlabeled synthetic media can be flagged/penalized — X has enforced hard against undisclosed AI video in sensitive categories.

EU AI Act (applies across platforms)

The EU AI Act's transparency rules require AI-generated content to be labeled in a **machine-readable, detectable** way and become **fully applicable on 2 August 2026**. Any platform operating in the EU must have compliant labeling in place — another reason to disclose by default rather than rely on a single platform toggle.

□ **Dated claim — review by 2026-08-02.** The EU AI Act transparency obligations become fully applicable on that date; this paragraph goes materially out of date the moment it passes. Re-verify before relying on it (checked 2026-07-19).

Belt-and-suspenders best practice

Beyond the platform toggle, **add a tiny on-screen note** ("AI-generated visuals" / "AI voice") for any realistic synthetic media. It protects you across every platform when you cross-post, and it builds audience trust.

Why bother

- It's required; non-compliance risks removal and demonetization.
- DGD content is financial-adjacent and educational — credibility is everything. A "this uses an AI voice" note costs you nothing and signals honesty.
- It pairs naturally with your **FTC disclosure** and "not financial advice" note.

Platform policies change often — verify at each platform's help center before relying on this.

Making it land

Hooks Library — Scroll-Stoppers for DGD Education

50+ opening lines, all compliance-safe (curiosity, not profit). Swap in your topic. The hook is ~80% of performance — write 5, pick 1.

Every hook here teaches an idea. None promises money. Keep it that way. → [do & don't](#)

The 3 highest-performing 2026 frameworks

Contrarian Claim ("everything you think is wrong")

- "Most 'crypto payments' aren't actually money. Let me prove it."
- "Saving money is making you poorer. Here's the math."
- "Bitcoin isn't really used as money — and that's by design."
- "Your bank account is a slow leak you can't see."

Mistake Warning ("you're doing X wrong")

- "If you think inflation is just 'prices going up,' you're missing the real story."
- "Everyone gets 'sound money' wrong. Here's what it actually means."
- "Stop thinking about crypto as a lottery ticket. Think about this instead."

List Tease ("there are N things...")

- "There are 6 things real money needs. Most currencies fail at least one."
- "4 numbers decide what a cryptocurrency is actually worth."
- "3 economists figured out money 100 years ago. We forgot."

By curiosity trigger

Shocking number

- "The US dollar lost over 96% of its value since 1913."
- "The money supply grew 7,000-FOLD in one century."
- "A 2% inflation target cuts your savings in half every 35 years."

The question hook

- "What makes something *money* and not just stuff?"
- "Who actually decides what a coin is worth?"
- "What if money had rules no government could rewrite?"

The "test/secret" hook

- "Here's a 5-second test for whether something is really money."
- "There's a reason every altcoin moves with Bitcoin. Nobody explains it."

The story/history hook

- "In the 1920s the stock market had no way to value anything. Sound familiar?"
- "Gold became money for 5 reasons. Code can now copy all 5."
- "Three thinkers — Menger, Mises, Hayek — predicted all of this."

The analogy hook

- "Imagine a ruler that changed length every day. That's the dollar."
- "The meter never changes. Why should the measure of value?"

The myth-bust hook

- "'Crypto is just gambling' — partly true, and here's the part that isn't."
- "No, more coins doesn't mean richer. Here's why."

Positioning hooks: "safe harbor" & anti-degen

(See [positioning & audiences](#) and [safe-harbor page](#).)

"Boring on purpose" / anti-degen

- "This might be the most boring coin in crypto. On purpose."
- "Crypto Twitter is 99% degen plays. Here's the 1% nobody posts."
- "Tired of getting rekt? There's a different idea of what money is."
- "Everyone's chasing the next 100x. This was built so there's nothing to chase."
- "The most contrarian thing in crypto right now: boring, sound money."

"Safe harbor" (legal, not financial)

- "'Safe harbor' in crypto does NOT mean what you think."
- "Is your coin a security? There's finally a test. Let's run it."
- "One phrase in the SEC's new definition decides everything: 'rather than from expectations of profit.'"
- "Why would a coin *want* to be called boring infrastructure?"

⚠ These hooks attract a speculative audience but the payload must stay educational. Never tip into "ape in," "100x," or "safe investment." → [do](#) & [don't](#)

Hook engineering checklist

- **≤ 8 words** if possible; punchy.
- Creates an **open loop** you must close.
- Pairs with a **strong first frame** (the visual is half the hook). → **images & thumbnails**
- **No banned words** (invest, moon, returns...). → **do & don't**
- Spoken **and** on-screen as text.

Pro move: the "loop-back" ending

End by reopening curiosity to drive replays/follows: - "...and that's only the first of the six. Follow for the rest." - "Watch it again — the number in second 2 changes how you read the rest."

Connects to

- **Viral principles** · **Story structures** · **Script prompts**

Story Structures for 30-60s Explainers

Reusable skeletons. Drop a DGD topic into any of these and you have a script.

1. Hook → Gap → Payoff → Loop (the workhorse)

- **Hook (0-1s):** scroll-stopper. → **hooks**
- **Gap (1-5s):** name the thing they don't know ("but here's what nobody explains...").
- **Payoff (5-35s):** deliver the insight, one idea, with visuals.
- **Loop (35-45s):** reopen curiosity + soft CTA ("follow for the rest / read the white paper").

Example (Scarcity): "Saving money is making you poorer [hook] . We're taught saving is safe — but the supply keeps growing [gap] . The US money supply grew ~7,000-fold in a century; more units chasing the same goods means each unit buys less. Code can cap supply instead — like a 21-million limit that can't be raised [payoff] . That's one of six things 'real money' needs — follow for the other five [loop] ."

2. Myth → Reality → Why it matters

- State a common belief → flip it → explain the consequence.
- *Example:* "More coins means more value [myth] — actually a fixed cap matters more than the number [reality] — because predictability is what makes money hold value [why] ."

3. Question → Exploration → Answer

- Open with a real question, explore 2-3 beats, land the answer.
- *Example:* "What actually makes something money? Menger said: the most saleable good wins. Durable, divisible, portable, scarce, wanted. Gold hit all five. Now code can too."

4. Number → Breakdown → Takeaway

- Lead with a striking stat, decompose it, leave one lesson.
- *Example:* "4 numbers decide a coin's fair value: adoption — weighted 70% — plus transactions, transaction value, and active developers. Mostly, it's about how many people really use it."

5. Then vs. Now (history hook)

- Past → present parallel. Great for monetary history.
- *Example:* "1920s stock market: tons of speculation, no way to value anything. 2026 crypto: same problem. Here's one attempt at a yardstick."

6. The Analogy Build

- One sticky analogy, extended.
- *Example:* "A ruler that changes length every day would be useless. That's what inflation does to the dollar as a measure of value."

7. Listicle (series engine)

- "N things..." with quick beats; each item can also be its own video.
- *Example:* "6 rules of real money: scarcity, stable pricing, free adoption, decentralized governance, freedom to transact, circulation."

Structural rules that apply to all

- **One idea per video.** If you have two, make two videos.
- **Front-load value.** Don't save the good part for the end on short-form.
- **Show, don't just say.** Pair each line with a visual change. → [editing](#)
- **End educational.** CTA is "learn more / follow / read the white paper," never "buy." → [discipline](#)

Map structures to DGD topics

Topic	Best structure
Inflation / why money loses value	Number → Breakdown
Six Pillars (series)	Listicle + one Hook→Gap→Payoff per pillar
CFV / fair value	Number → Breakdown or Question → Answer
"Is it really money?" circulation	Myth → Reality
Austrian economists	Then vs. Now / Question → Answer
Scarcity / 21M cap	Myth → Reality or Analogy

Connects to

- [Hooks](#) · [Viral principles](#) · [Script prompts](#) · [Series ideas](#)

Positioning DGD & Reaching Crypto Audiences

How to frame Digital Gold for different audiences — including the "degen" crowd — and grab attention in a noisy market **without** breaking the **communications discipline**. Positioning is about *who you're talking to and how*, never about promising outcomes.

The core positioning: "boring on purpose"

DGD's identity is the **anti-speculation** coin. The White Paper says it plainly: "*This is not a speculative instrument.*" In a market built on hype, that's a **feature**, not a weakness — and it's your sharpest hook. Lean into it:

- "Sound money, not a moonshot."
- "The coin that's boring on purpose."
- "Designed to be money, not a lottery ticket."

This framing is compliant *and* contrarian — which is exactly what cuts through.

The "degen" angle (handle with care)

"**Degen**" (degenerate) is crypto slang for high-risk gamblers chasing 100x plays, memecoins, and "apeing in." The word appears **nowhere** in DGD's white paper — because DGD is the **philosophical opposite** of degen culture. That contrast is the whole opportunity.

The smart play: speak to degens, don't become one

The degen-heavy audience (Crypto Twitter/X, crypto TikTok) is huge and bored of being sold the next gem. You can reach them with a **contrarian, educational, anti-gambling** message:

- "Crypto Twitter is 99% degen plays. Here's the 1% philosophy nobody posts about."
- "Tired of getting rekt? There's a whole different idea of what money is."
- "Everyone's chasing the next 100x. This coin was designed so there's *nothing* to chase."
- "The most contrarian thing in crypto right now? Boring, sound money."

You can use the **lingo** ("rekt," "aped in," "exit liquidity," "casino") to grab attention and build rapport — as long as the **payload is education**, not a pitch.

☐ The line you do NOT cross

Do **not** market DGD as a degen play. The instant you say "ape into DGD," "next 100x gem," "this is the degen bag that prints," you have: 1. Broken the **communications discipline**

(speculation/profit framing), **and** 2. Undermined DGD's **safe-harbor / digital-commodity status**, which depends on value *not* coming from "expectations of profit."

So the rule is simple:

Do	Don't
Use degen culture as a contrast ("the anti-casino coin")	Position DGD as a degen play
Borrow the lingo to hook attention	Use lingo to imply gains ("100x," "printing," "ape in")
Talk to ex-degens about why sound money is different	Promise it'll "pump" or "moon"
"Stop gambling, start understanding money"	"This is the gamble that pays off"

One-liner: *Talk to degens. Don't sell a degen play.*

Example: ready-to-shoot script — "The Anti-Degen Coin"

Time	Spoken	On-screen text	Visual
0–1s	"This might be the most boring coin in crypto. On purpose."	BORING ON PURPOSE	Slot machine powering down
1–6s	"No 100x promises. No 'ape in.' That's the entire point."	NOTHING TO CHASE	Calm gold coin
6–30s	"Most of crypto is a casino — chase the pump, hope you're not exit liquidity. Digital Gold was designed the opposite way: fixed rules, a price tied to how many people actually use it, and a structure built so there's nothing to gamble on. It's an attempt at <i>money</i> , not a bet (WP Abstract, §2.2)."	CASINO vs SOUND MONEY	Split screen: chaos vs steady line
30–37s	"Not financial advice — just a different philosophy of money. Read the white paper and decide for yourself."	A DIFFERENT PHILOSOPHY	Outro

Disclosure + AI labels as always. → [pre-publish checklist](#)

Audience segments & how to frame for each

Pick the audience per video; the *message* stays educational for all of them.

Audience	Where	Hook angle	Watch-out
Ex-degens / "rekt" traders	X, TikTok	"Tired of the casino? Here's another way to think about money."	Don't imply DGD is the winning bet
No-coiners / normies	TikTok, Reels	"You don't need crypto — but you should understand why your money shrinks."	Keep it jargon-free
Inflation-worriers	all	"Your savings lose value every year. Here's the mechanism."	Don't pitch DGD as the fix-for-profit; teach the idea
Gold bugs / sound-money fans	X, YouTube	"What gold got right about money — and how code copies it."	Complement, don't claim superiority/returns
Bitcoiners	X, YouTube	"Bitcoin is digital gold — a store of value. DGD aims at a different job: circulating money."	Frame as complementary, not competitive (WP §17); avoid "better investment"
Small merchants	YouTube, Reels	"Why most crypto 'payments' never actually circulate — and the supply-chain idea."	Educational, not a buy-pitch
Privacy advocates	X	"Money and surveillance: what 'freedom to transact' means."	Don't imply law evasion

Bitcoin vs DGD — the careful version

The White Paper frames them as **complementary**: Bitcoin = digital gold / store of value; DGD = wealth-preserving *money* / medium of exchange (WP §17). - □ "Different jobs: one's a vault, one's meant to circulate." - □ Avoid "DGD is the better investment than Bitcoin" or "hold both to profit." Compare **design and function**, never expected returns.

Content franchises (repeatable series built on this)

Each is a recurring format your audience can follow. → [series ideas](#)

1. **"Boring Money"** — a running series celebrating un-sexy, sound-money design. Brand consistency around the anti-hype identity.
2. **"Rekt Lessons"** — what speculation blow-ups teach about *why* sound money is designed differently. (Educational post-mortems of public, well-known events — no naming/shaming individuals, no false claims.)
3. **"Is It a Security?"** — explainer series running the digital-commodity test, the Howey test, the [safe-harbor](#) framework. Surprisingly engaging and deeply on-brand.
4. **"Casino vs Money"** — recurring contrast format: a degenerate behavior vs the sound-money alternative.
5. **"Words Crypto Stole"** — define the lingo (degenerate, rekt, exit liquidity, safe harbor, store of value) accurately. Great reach + genuinely educational.

6. **"Two Kinds of Digital Gold"** — Bitcoin's store-of-value vs DGD's circulating-money function (complementary framing).
-

More idea seeds (in the spirit of the wiki)

- **Myth-bust "safe" words:** a short clarifying that "safe harbor" $\neq$ "safe investment." (Pairs with the [safe-harbor page](#).)
- **"The phrase that decides everything":** unpack "*rather than from expectations of profit*" from the 2026 definition.
- **"Why a coin would brag about being boring":** counter-intuitive identity piece.
- **"Exit the casino" mini-series:** for the ex-degen audience, a calm, repeated visual motif (leaving a neon casino into daylight).
- **Glossary shorts:** one [glossary](#) term per video — degen, rekt, safe harbor, digital commodity, store of value, sound money.

Compliance backstop

Every angle here still passes through the same gates: educational, no investment/price/return framing, disclosure + AI labels, facts checked vs the white paper. Run the [pre-publish checklist](#) every time.

The free toolkit

The Free AI Toolkit — Overview

Everything you need to make a polished short-form video for **\$0**, organized by job. Free tiers change constantly — **always re-check the source link before relying on a limit.**

The pipeline (each job → its page)

Step	Job	Go to	Top free pick (Jun 2026)
1	Idea + script	Ideation & scripting	ChatGPT / Claude / Gemini free tiers
2	Voiceover	Voiceover / TTS	Your own voice , Microsoft Edge Read Aloud (ElevenLabs free is not commercially licensed)
3	Visuals (generate)	Video generation	Google Veo (Gemini free), Kling AI, Hailuo
3b	Still images	Images & thumbnails	Google Gemini/Imagen, Leonardo (Bing free is personal-use only)
4	Edit + captions	Captions & editing	CapCut (free, full editor)
5	Music / sound	Music & sound	YouTube Audio Library, Pixabay, Uppbeat
6	Put it together	End-to-end workflows	"Faceless explainer" free stack

⚠ Commercial use — read this before picking any tool

Ambassador content is commercial. The promotional pathway can pay you DGD recognition, which creates a material connection ([participation pathways](#)). That means "free for personal use" tiers **do not cover you**, and this is the single most common way to get a strike or a takedown that has nothing to do with compliance framing.

Tool	Free tier OK for rewarded content?
Your own voice	☑ always
Microsoft Edge Read Aloud / Edge TTS	☑
CapCut (editor + TTS)	☑
Google Gemini / Imagen	☑ commercial permitted, no watermark
Leonardo AI	☑ free plan allows commercial
YouTube Audio Library · Pixabay · Uppbeat	☑ cleared libraries
Adobe Firefly	⚠ commercial allowed, but free users get no IP indemnification
Canva free Magic Media	⚠ only under Canva's content licence
ElevenLabs free	☑ no commercial licence , and requires "elevenlabs.io" in the title
Bing Image Creator free	☑ non-commercial personal use only
Ideogram free	☑ commercial requires paid
Trending platform audio	☑ licensed for personal use, not branded content

Watermarks are a *separate* question from licensing — a watermark-free export can still be non-commercial. Check both.

Terms change. Re-confirm on the tool's own site before you rely on this table (last verified 2026-07-19).

Two honest realities about "free"

1. **Free tiers shift monthly.** Credits, watermarks, resolution caps, and even tool names change. Every tool page is tagged `verified: 2026-06`. Treat specifics as "last known," and confirm on the tool's site.
2. **Watermarks matter for cross-posting.** A watermark from one app can get your video down-ranked or rejected on another platform. Prefer no-watermark free exports where possible (noted per tool).

Recommended "all-free" starter stack (intermediate creator)

Script: ChatGPT/Claude/Gemini free → **Voice:** your own voice or Edge Read Aloud (label AI if synthetic) → **Visuals:** Veo via Gemini or Kling free + **Gemini/Imagen or Leonardo** images → **Edit & captions:** CapCut → **Music:** YouTube Audio Library / Pixabay → **Schedule:** native platform schedulers or a free Postiz/Buffer tier.

Full step-by-step: [workflows.md](#).

Golden setup rules

- **Keep a /raw folder** of your generated clips, voiceovers, and images so you can reuse and re-cut. (Mirrors the wiki's raw-sources idea.)
- **Caption everything** — most short-form is watched on mute.
- **Export vertical 1080×1920** unless a platform needs otherwise. → [platform specs](#)
- **Disclose AI voices/avatars and your sponsorship** every time. → [AI disclosure](#) · [FTC](#)

A note on tool choice and the message

No tool excuses a bad script or a compliance slip. The [communications discipline](#) governs the *content* no matter how it's made. Great tools + safe, educational message = your edge.

Connects to

- [Workflows](#) · [Prompt library](#) · [Viral principles](#)

End-to-End Free Workflows

Three complete, \$0 pipelines from idea to posted video. Pick the one that fits your time and comfort.

Workflow A — "Faceless Explainer" (fastest, no camera)

Time: ~1-2 hours · Best for: TikTok, Reels, Shorts, X

1. **Script** — ChatGPT/Claude/Gemini with a compliance-locked prompt from the [prompt library](#). Fact-check vs [dgd/](#).
 2. **Voice** — [your own voice](#) or [Edge Read Aloud](#). Label as AI if synthetic. **Not ElevenLabs free** — no commercial licence, and it requires "elevenlabs.io" in your title.
 3. **Visuals** — abstract b-roll from [Veo/Kling](#) + title cards from [Gemini/Imagen](#) or [Leonardo](#) (**not Bing free** — personal use only). Gold, inflation, supply-chain themes. Title cards are better rendered with `dgd.py assets title`.
 4. **Edit + captions** — [CapCut](#): assemble, auto-caption, proofread, add disclosure overlays.
 5. **Music** — [YouTube Audio Library](#) / [Pixabay](#), ducked under voice.
 6. **Compliance pass** — [pre-publish checklist](#).
 7. **Post** — vertical 1080×1920; front-load disclosure; native captions/hashtags per [platform specs](#).
-

Workflow B — "Talking Head + B-roll" (most trust)

Time: ~1-2 hours · Best for: building a personal ambassador brand

1. **Script / bullet points** — AI outline, but speak in your own words.
2. **Film yourself** on a phone (good light, quiet room). Your real voice = no AI-voice disclosure needed and higher trust.
3. **B-roll overlays** — drop AI/stock clips over your talking head to illustrate (gold, charts, supply chain).
4. **Edit + captions** — [CapCut](#): punch-ins, captions, disclosure overlays.
5. **Music + SFX** — subtle, cleared library.
6. **Compliance pass + post.**

For financial-adjacent education, a real human face often outperforms faceless AI for trust and follows. Consider B for "who am I / why I care" content and A for pure explainers.

Workflow C — "Batch & Schedule" (consistency at scale)

Time: a half-day to make a week of content

1. **Plan** a week from the [content calendar](#) (e.g., a Six Pillars series).
 2. **Batch-script** all 5–7 videos in one AI session (compliance-locked prompt).
 3. **Batch-produce**: generate all voiceovers, then all b-roll, then edit back-to-back in CapCut (reuse a template project).
 4. **Compliance pass on each** before scheduling.
 5. **Schedule**: use native schedulers (YouTube, Meta Business Suite) or a free tier (Postiz / Buffer). Mind [X automation rules](#) — no spammy duplicate posting; tailor captions per platform.
-

Reusable project hygiene

- Keep a **CapCut template** with your caption style + disclosure overlays pre-built — drop in new audio/clips each time.
- Maintain a [/raw](#) **asset folder** (clips, voiceovers, title cards) to remix later.
- Save a **"compliance overlay" PNG** ("SPONSORED · NOT FINANCIAL ADVICE") to reuse.

The non-negotiable last step

Every workflow ends at the [pre-publish checklist](#). No exceptions.

Connects to

- [Toolkit overview](#) · [Prompt library](#) · [Viral principles](#) · [Content calendar](#)

Ready to shoot

Ready-to-Shoot Scripts — "The 6 Rules of Real Money"

A complete 8-episode educational series you can produce today. Every line is **compliance-safe** (educational, no investment framing). Each episode: ~30-40s. Facts cite the White Paper (WP). Produce with any [workflow](#); finish each at the [pre-publish checklist](#).

Disclosure reminder: if you receive DGD ambassador recognition, add the spoken + on-screen + caption disclosure to **every** episode. A reusable disclosure line is given once below — repeat it on each.

Reusable disclosure (use on every episode) - Spoken (first ~3s): *"Quick heads-up — I'm part of the Digital Gold ambassador program, so this is sponsored and educational, not financial advice."* - On-screen (0-3s): **SPONSORED · EDUCATIONAL · NOT FINANCIAL ADVICE** - Caption start: **#Ad — educational, not financial advice.**

Series format (keep consistent): - Same 1.5s intro card: "THE 6 RULES OF REAL MONEY — Rule X of 6" - Same outro card: "Follow for the rest · Read the white paper to judge for yourself" - Palette: gold + navy. Captions burned in, 1-3 words at a time.

EP 0 — "The 6 Things Real Money Needs" (intro)

Time	Spoken	On-screen text	Visual
0-1s	"Most money fails a basic test."	MOST MONEY FAILS THIS	Gold coin spinning on dark marble
1-6s	"Economists spent a century figuring out what <i>real</i> money needs. They landed on six things."	6 RULES	Six glowing dots appear
6-28s	"Scarcity. Stable value. Free to choose. Rules nobody can rewrite. Free to spend privately. And it has to actually circulate. Miss one... and the money slowly fails the people using it."	list the 6, one by one	Each rule lights up in turn
28-35s	"Over the next six videos, I'll break down each one — and why they're so hard to get right. Follow along."	RULE 1 TOMORROW →	Outro card

Hook alts: "There are 6 rules for real money — the dollar breaks at least one." / "What makes something *money* and not just stuff?" **Hashtags:** #soundmoney #economics #moneyexplained #fintcheducation #cryptoeducation

EP 1 — Scarcity

Time	Spoken	On-screen text	Visual
0-1s	"Saving money is quietly making you poorer."	SAVING ≠ SAFE	Banknote stack
1-6s	"Rule 1 of real money: scarcity. Supply has to be limited by clear rules."	RULE 1: SCARCITY	Intro card
6-28s	"Here's the problem. The US money supply went from about 3 billion dollars in 1913 to over 21 trillion — roughly a 7,000-fold increase (WP §2.2). More units chasing the same goods means each one buys less. Code can fix this — a fixed cap that can't be raised. Bitcoin proved it with 21 million. Digital Gold uses the same 21-million cap by design (WP §2.2)."	7,000x ↑ · 21,000,000 CAP	Coins multiplying, then a hard cap line
28-35s	"Scarcity is rule one. Tomorrow: why a <i>stable</i> price matters even more. Follow."	RULE 2 NEXT →	Outro

Compliance note: state the 21M cap as a *design fact*. Do **not** add "so it'll go up." → **do & don't** **Hashtags:** #inflation #soundmoney #scarcity #economics #moneyexplained

EP 2 — Stable Pricing

Time	Spoken	On-screen text	Visual
0-1s	"A ruler that changed length every day would be useless."	IMAGINE THIS	Wobbling ruler
1-6s	"That's rule 2: stable pricing. Money should hold its value."	RULE 2: STABLE VALUE	Intro card
6-28s	"A 2% inflation target sounds tiny. But it means the dollar loses <i>half</i> its purchasing power about every 35 years (WP §2.2). Bitcoin swings the other way — huge long-term moves, but wild day-to-day, which makes it hard to use as everyday money. Digital Gold's design ties price to a fixed curve based on real adoption — aiming for predictability instead of speculation (WP §2.2)."	½ VALUE / 35 YRS	Melting dollar; steady curve vs jagged curve
28-35s	"Stable value is rule two. Next: who even gets to <i>choose</i> their money. Follow."	RULE 3 NEXT →	Outro

Compliance note: "predictability" describes the *design goal*, not a price promise.
Hashtags: #inflation #purchasingpower #economics #soundmoney #moneyexplained

EP 3 — Free Adoption

Time	Spoken	On-screen text	Visual
0-1s	"You never <i>chose</i> the money in your pocket."	YOU DIDN'T CHOOSE THIS	Wallet/cash
1-6s	"Rule 3: free adoption. Real money is picked by people, not forced by decree."	RULE 3: FREE ADOPTION	Intro card
6-28s	"National currencies are backed by legal-tender laws — you use them because you have to. No cryptocurrency was forced on anyone; people opt in (WP §2.2). The economist Friedrich Hayek argued back in 1976 that currencies should <i>compete</i> , and the best one for users wins. Digital Gold is built to be voluntary at every step (WP §2.1-2.2)."	HAYEK, 1976 · OPT-IN	Two currencies side by side; a hand choosing
28-35s	"Chosen, not forced — rule three. Next: rules no government can rewrite. Follow."	RULE 4 NEXT →	Outro

Hashtags: #hayek #freemarket #economics #soundmoney #cryptoeducation

EP 4 — Decentralized Governance

Time	Spoken	On-screen text	Visual
0-1s	"What if money had rules no one could rewrite overnight?"	RULES, NOT RULERS	Lock over a ledger
1-6s	"Rule 4: decentralized governance. Rules, not rulers."	RULE 4: GOVERNANCE	Intro card
6-28s	"Most money is governed by committees who can change the rules — and do. Real money should run on rules no single authority can alter (WP §2.2). Digital Gold's rules were set at the start and <i>can't</i> be changed — the white paper calls it the 'inversion of governance': there's nothing to govern because nothing changes (WP §12.15)."	FIXED AT INCEPTION	Gears freezing into a locked seal
28-35s	"Rules over rulers — rule four. Next: the freedom to actually spend it. Follow."	RULE 5 NEXT →	Outro

Hashtags: #decentralization #governance #soundmoney #economics #cryptoeducation

EP 5 — Freedom to Transact

Time	Spoken	On-screen text	Visual
0-1s	"Every card swipe is watched. Cash isn't."	SWIPE = WATCHED	Card terminal, an eye
1-6s	"Rule 5: freedom to transact — to use your money without permission."	RULE 5: FREEDOM	Intro card
6-28s	"Real money should let you transact without surveillance, censorship, or asking permission from a middleman (WP §2.2). Cash does this; most digital money doesn't. Digital Gold builds in privacy networking — native Tor support — so transactions can stay encrypted and private by design (WP §2.2)."	PRIVATE BY DESIGN	Encrypted network animation
28-35s	"Freedom to spend — rule five. Last one's the hardest: does it actually circulate? Follow."	RULE 6 NEXT →	Outro

Compliance note: explain privacy as a *design property*; avoid implying evasion of laws.

Hashtags: #privacy #freedom #soundmoney #economics #cryptoeducation

EP 6 — Adequate Circulation (the hardest rule)

Time	Spoken	On-screen text	Visual
0-1s	"Most 'crypto payments' aren't actually money. Here's the test."	THE MONEY TEST	Coin → store
1-6s	"Rule 6: adequate circulation. Money has to <i>flow</i> through the whole economy."	RULE 6: CIRCULATION	Intro card
6-30s	"Watch what happens. You pay a shop in crypto — but the shop instantly converts to dollars. The coin transacted <i>once</i> , then left. It never became money (WP §9). Real money keeps moving: shop pays the wholesaler, who pays the maker, who pays the raw-material supplier. Digital Gold's single-price design is built so a business can <i>hold</i> it and pay suppliers — link by link down the chain (WP §8-9)."	CONVERT = NOT MONEY	A coin flowing through shop→truck→factory→mine
30-37s	"That's all six rules of real money. Want to judge whether one project actually hits them? The white paper's in the description. Follow for the recap."	ALL 6 ✓	Outro

Hashtags: #money #supplychain #economics #soundmoney #moneyexplained

EP 7 — Synthesis: "Can Anything Hit All Six?"

Time	Spoken	On-screen text	Visual
0-1s	"Hitting one of these rules is easy. Hitting all six is brutal."	ALL 6 IS HARD	Six dots, five lit
1-6s	"Scarcity, stable value, free adoption, fixed rules, freedom to transact, real circulation."	THE 6 RULES	Recap card
6-30s	"Most money nails a few and breaks the rest. The dollar? Free to spend, widely adopted — but not scarce and not stable. Bitcoin? Scarce and free — but volatile and mostly <i>held</i> , not circulated. Digital Gold is one attempt to design for all six at once — capped supply, adoption-based pricing, fixed rules, built-in privacy, and a structure meant to keep it circulating (WP §2.2, §8-9). Whether it works is for you to evaluate."	DOLLAR vs BTC vs DESIGN-FOR-6	Simple comparison grid
30-37s	"I'm not here to sell you anything — just to show you the framework. Read the white paper and decide for yourself. Follow for more money explainers."	JUDGE FOR YOURSELF	Outro

Compliance note: the comparison is about *design against six criteria*, never "which will make you money." Keep it analytical. → [communications discipline](#) **Hashtags:** #soundmoney #bitcoin #economics #moneyexplained #cryptoeducation

Production notes

- **Batch it:** script's done — record all 8 voiceovers, then all b-roll, then edit on one [CapCut template](#). → [Workflow C](#)
- **Visuals:** pull from [image & video prompts](#) (gold, inflation erosion, supply-chain flow, network).
- **Verify every figure** against [dgd/six-pillars.md](#) before posting.
- **Run pre-publish checklist on each episode.**

Connects to

- [Six Pillars](#) · [Series ideas](#) · [Story structures](#) · [Script prompts](#)

Pre-Publish Checklist — Run This Every Single Time

Copy it into your notes and tick every box before you post. If any **Compliance** box fails, **do not publish** until fixed.

☐ Compliance (mandatory — all must pass)

- [] **No investment framing.** Nothing calls DGD an investment or implies financial gain. (discipline)
- [] **No price prediction.** No "\$X target," "to the moon," "early," charts implying gains.
- [] **No return/profit promises.** No "returns," "ROI," "passive income," "I made money."
- [] **No solicitation.** CTA is "learn more / read the white paper / follow," never "buy."
- [] **Banned-word scan done** on script, captions, on-screen text, thumbnail, hashtags. (do & don't)
- [] **FTC disclosure present** (if rewarded): spoken in first seconds + on-screen + caption front-loaded + platform branded-content toggle ON. (FTC)
- [] **AI disclosure present** (if realistic AI voice/avatar/video): platform label + on-screen note. (AI disclosure)
- [] **"Not financial advice"** stated (spoken + caption).
- [] **Facts verified** against the white paper / dgd/. No invented numbers.
- [] **No realistic fake people/events** generated. No false attribution. (video gen)

☐ Quality

- [] Hook lands in the **first second** (visual + words). (hooks)
- [] **One idea**, delivered clearly, with a payoff.
- [] **Captions** burned in and **proofread** (esp. names/numbers).
- [] Visual change every ~2 seconds; no dead air.
- [] Audio clean: voice on top, music ducked, no clipping.
- [] Strong **first frame** (it's your de-facto thumbnail).
- [] Loop-back / soft CTA at the end.

☐ Technical

- [] **1080×1920, 9:16**, MP4. (specs)
- [] Text inside the **safe zone** (not under platform UI).
- [] **No unwanted watermark** from any tool.
- [] Music is from a **cleared library** with license saved (and covers this platform). (music)
- [] Per-platform: title/caption/hashtags tailored; disclosure label toggled.

□ Music licensing

- [] Track cleared for **commercial + this platform + short-form**.
- [] Attribution added if required.

The final gut check

"If a viewer never acquires a single coin, is this still a useful, honest, educational video?"
If **no** → it's a pitch, not education. Rewrite before posting.

Connects to

- [Communications discipline](#) · [Compliance overview](#) · [Workflows](#)
